

Indonesia - Banda Islands: Tanjung Pisang (Banana Island)

Maluku · surveyed 2018-04-25

© coralreefdiagnostics.com

Coral Health Index: TBD

What was done. No diver transect was run at this site. The figure is a blind Claude computer-vision point classification of 180 photographs by the author, read without sight of any other method's result; other computer-vision methods are compared on the site page. The written account of the site is a review of its photographs, not a second survey.

POSITION

-4.5400, 129.9100

Approximate position: no GPS fix was logged for this dive.

Tanjung Pisang is a steep wall running from coralline pavement through a soft-coral-draped section into a genus-rich upper terrace and a near-continuous *Acropora* carpet at its back half. A cluster of about five large plating corals was found bleached stark white with tissue still present, and a second pair of pale *Porites*-type colonies nearby suggests scattered, low-incidence paling across the reef rather than a single spot. No COTS, *Drupella*, or disease seen. A blind Claude computer-vision point count puts coral cover around 36%.

Bahasa Indonesia. Tanjung Pisang adalah dinding curam yang membentang dari hamparan berkerak koralin, melewati bagian yang berselimut karang lunak, menuju teras atas yang kaya genus dan hamparan *Acropora* yang hampir menyambung di paruh belakangnya. Sekelompok sekitar lima koloni karang lembaran besar ditemukan memutih pucat dengan jaringan yang masih ada, dan sepasang koloni bertipe *Porites* yang pucat di dekatnya menunjukkan pemucatan yang tersebar dan berinsiden rendah di seluruh terumbu, bukan satu titik tunggal. *Terjemahan ringkasan ini oleh AI; versi bahasa Inggris yang berlaku.*
