

Indonesia - Komodo NP: Tatawa Kecil

Komodo · surveyed 2019-01-27

Coral Health Index: TBD

What was done. No diver transect was run at this site. The figure is a blind Claude computer-vision point classification of 83 photographs by the author, read without sight of any other method's result; other computer-vision methods are compared on the site page. The written account of the site is a review of its photographs, not a second survey.

POSITION

-8.5350, 119.6400

A genuinely rich but visibly disturbed *Acropora* reef in Komodo: healthy tables and colorful thickets of branching coral stand beside and on top of beds of bone-white broken *Acropora* rubble. Anderson lost his slate on this dive, so the photographs are the main record, and they show many small reef fish.

Bahasa Indonesia. Anderson menyelami lokasi ini satu kali, pada 27 Januari 2019 (07:34, 60 menit, kedalaman maksimum 22.3 m, rata-rata 7.9 m, 26.1 derajat C), dan kehilangan papan catatannya, sehingga kelima foto itulah catatan yang paling mendeakati. *Terjemahan ringkasan ini oleh AI; versi bahasa Inggris yang berlaku.*

CV model comparison (hard-coral cover, %): In-house DINOv3 28.8 · CoralSCOP edited 37.9 · Claude (edited photos) 32.1

Photographs: Anderson Mayfield/Coral Reef Diagnostics — 3 of 50 on file; watermarked · Full site record: <https://api.coralreefdiagnostics.com/site-pages/indonesia-komodo-np-tatawa-kecil.html> · Heat stress is the mean of the latest five annual maxima of NOAA Coral Reef Watch degree-heating weeks for this reef's NOAA CRW virtual station (East Nusa Tenggara) — a five-year heat history for the station's waters, not a measurement at this site on the dive date.
